Driver 039;S License Eye Chart Cheat

Generally, during the test to measure visual acuity, the eye doctor will make person being tested sit at a distance of six meters from the chart. If you dont wear glasses or contacts, the results of the test will show whether you need them. When you visit the doctor for the checkup, he or she may ask you to read an eye chart. What is visual acuity Measured using a special chart with rows of letter, visual acuity describes your ability to see detail with your central vision. The best way to find out whether or not you need glasses or contacts to improve your vision, the aforementioned chart is used during the initial screening phase of a routine eye exam. The optician will ask you to begin at the top and work your way to the bottom Once one eye has been tested, the same process will be repeated with the other eye and then with both eyes uncovered. Once everything is in place, the optician will ask you to cover one eye and read the letters on the chart aloud. Generally, an eye test or screening is performed with the help of an eye chart During a routine eye exam, the first thing an optician/eye doctor does is test the vision of the patient using this chart. In case the office of the optician isnt twenty feet long, the chart will be positioned behind you with a mirror placed on the opposite wall to replicate a distance of twenty feet. On the other hand, if you wear glasses or contacts, the results will show whether your contacts or glasses prescription needs changing.

The chart used to measure visual acuity starts with a big letter at the top and then the letters start to get smaller row by row. The minimum size of the letter that a person could see with a normal vision from six meters upto sixty meters is what the rows of letter correspond to.
